**Subject:** Re: Medical Student Research

I am seeking to work with a medical student interested in cancer and/or biostatistics & epidemiology for a research project. The student will investigate differences in survival for lung cancer patients based on rural vs. non-rural demographics using a national dataset. The goal would be to submit a poster to the UVM Cancer Center Control in a Rural Environment Symposium, which is on April 20th. This is open to all medical students. Prior statistical coding experience is preferred, but not mandatory. In addition to the Rural Environment Symposium, there may be additional opportunity for funded summer research. Please email me if you are interested!
